For over 20 years, Biovance has focused on research and development work for companies in the area of applied biotechnology with emphasis on animal nutrition and health. Our research has resulted in products that are owned, branded and sold by others throughout the world. In 1993, Biovance decided to market branded products and in 1995 introduced a series of natural products targeted for use in large animal agriculture. Two of these products, BioChlor and Fermenten, were sold to Church & Dwight in 2002.

Biovance currently manufactures and markets products that impact sows reproductive efficiency; accelerates aging and positively impacts tenderness in beef; that enhances the feeding value of distillers' grains for beef, sheep and dairy; that improves feed efficiency and daily gain and controls the incidence of urinary calculi in sheep and cattle. Biovance's newest product, ReStore™, represents extensive equine research and development of natural products designed to improve performance and overall health of horses.

Biovance's goal is to develop products based on theoretical outcomes derived from what scientific literature and research says will happen. Visit our website to read more about Biovance and our products at [www.restoreforhorses.com](http://www.restoreforhorses.com).
